Keys to understanding inequality in the world

Wealth concentration

10% of the population currently concentrates more than 50% of global wealth.

Extreme poverty

Nearly 700 million people in the world live in extreme poverty.

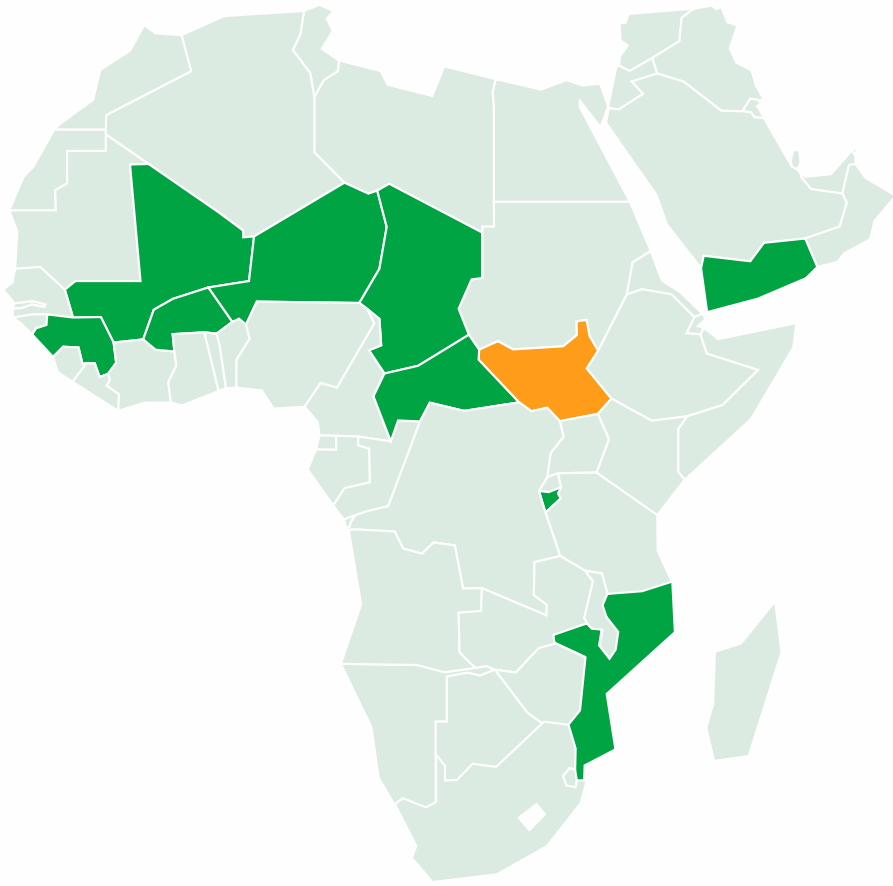

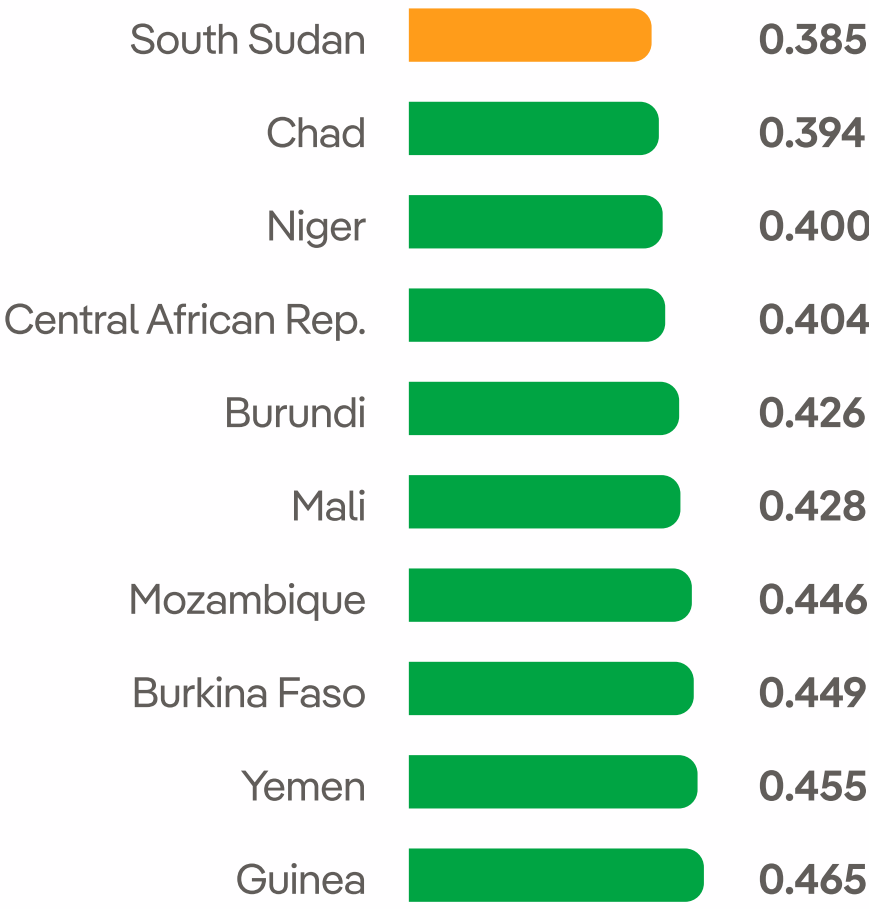

Inequality is also gender-based

Women are more likely than men to live below 50% of median income.

Countries with the lowest human development index

The Human Development Index is an indicator developed by the United Nations that classifies countries into three levels of human development. The index is composed of life expectancy, education and per capita income indicators.

Data from 2022.

Main causes

Current fiscal policies, which lead to a reduction in people's incomes; corruption and illicit capital flows; concentration of wealth; unequal access to education; in-work poverty; and unequal employment opportunities.

How can we end inequality?

We must promote more equitable access to education and well-paid jobs; put in place a global financial register to limit tax evasion; end the extreme concentration of wealth.
