

WHAT IS CORE?

CORE is an open system whose technical characteristics make it suitable for centralised operation, analysis and maintenance of renewable power plants.

Flexible, centralised configuration

The capacity to grow by adding (not replacing) equipment and applications.

Rapid incorporation of installations into the system

With a centralised database, advanced graphics and object-oriented technology.

Optimum use of communications channels

due to the collection of value-change data in real time.

Alert management

Direct operation based on information from alarms in case of incident.

Allows and integrates applications

according to business needs and regulatory changes.

Bulk information

Efficient and standardised processing of large amounts of data in real time.
