## THE CHALLENGER DEEP - A

The deepest point on the planet (11,000 m below sea level) is located in the Pacific Ocean, at the southern end of the Mariana Trench.

The first expedition to this abyss took place between 1872 and 1876. On that occasion the expedition managed to record a depth of 8,184 m.

The pit owes its name to the British Royal Navy ship HMS Challenger, which participated in its discovery. The water pressure in the deepest part of the abyss is approximately 1000 times greater than that at the surface.

In 2012, the film director James Cameron *(Titanic)* managed to descend alone to a depth of 10,898 m.

> Most of the organisms that live down there are **bioluminescent**. In addition, 20,000 microbes have been isolated and new species have been discovered.

PLASTIC IN THE OCEANS
