

## Sustainable development

# Eco-neighbourhoods, in the cities of the future

### Greenhouses

- Solar radiation is filtered through the glass.
- This heat allows plants to be grown out of season.

### Sustainable homes

- The water is accumulated on the roofs with retention systems. This water is used for bathrooms and gardens.
- The wooden window frames come from sustainably managed woods.

### Solar panels

The solar panels, on floors or ceilings, generate solar energy to guarantee supply to each home.

### Sustainable gardens

- Native and similar species are grown.
- The layout is designed to make full use of water.
- Trees are planted to the East and West of the houses to obtain the right amount of shade.

### Recycling and reuse Of waste

- Reduces pollution indices.
- Recycling articles extends their useful life.
- Use of biodegradable products prioritised.

### Means of transport

- The tram is the main means of transport.
- Shared electric cars and bicycles are the two preferred alternatives.
