13 CLIMATE ACTION

Keys to understanding climate change

Natural disasters

They have caused more than **2.5 million** deaths worldwide since 1980

Pollution

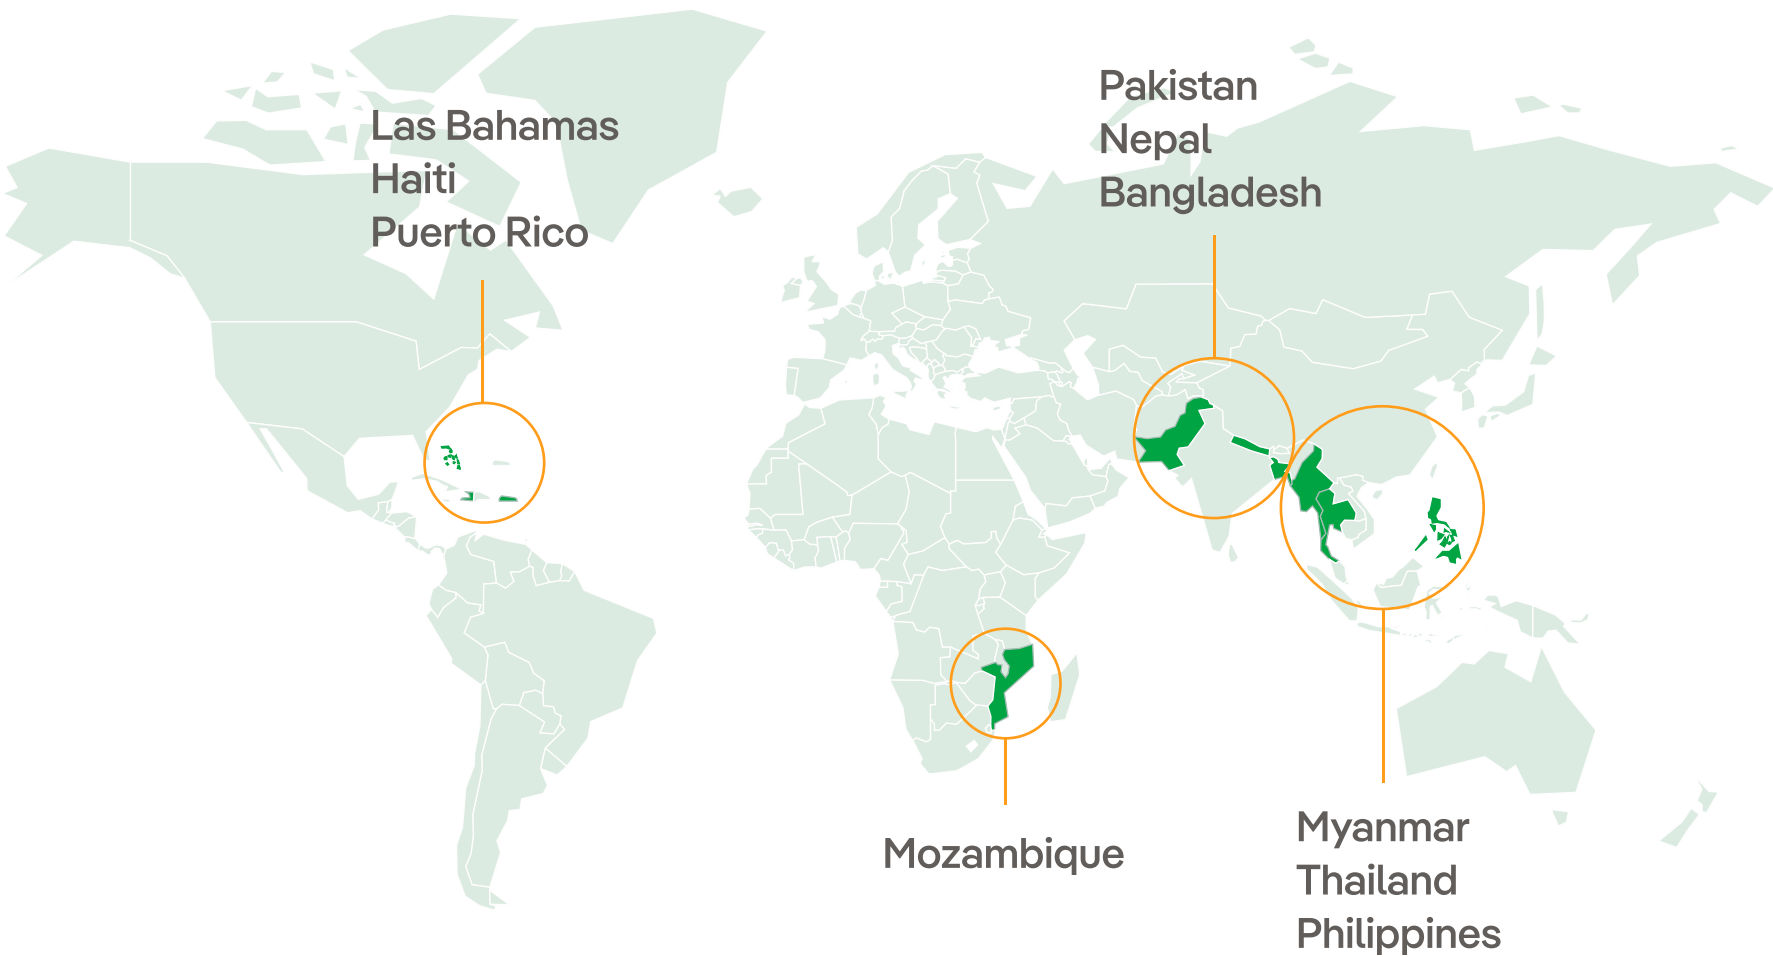

It causes at least **9 million** premature deaths a year

Forecast 2030 - 2050

Climate change will cause an additional **250,000** deaths each year

Most affected countries

Main causes

According to the UN, there are natural changes, due to variations in solar activity or large volcanic eruptions, but since the 19th century, human activities have been the main driver of climate change, mainly due to the burning of fossil fuels such as coal, oil and gas.

What are the consequences?

Consequences include, among others, intense droughts, water shortages, severe fires, rising sea levels, floods, melting of the poles, catastrophic storms and declining biodiversity.
