

Artificial General Intelligence: a possible timeline

A company called AI Multiple Research analysed the **predictions** of more than 8,500 scientists, leading entrepreneurs and communities about **the timeline for AGI**. They found that most of the experts in the field of AI are predicting that creating true AGI is inevitable, and that it could arrive **around 2040**. Entrepreneurs were even more confident, calling it for 2030. The following graph from **AI Multiple Research** shows how predictions for when “singularity” – the future point when **AGI** could hypothetically develop the ability to **improve itself at an accelerated rate** – could arrive. It includes predictions from **Metaculus**, an **online forecasting** platform and aggregation engine.
