

Hello,

When we talk about **sustainable mobility** as a more accessible, efficient and cleaner model, we are referring to **different transport alternatives** that complement each other with the aim of reducing the emissions caused by the movement of people and goods worldwide.

Cycling and walking, the use of private electric vehicles, collective public transport, car sharing, as well as the electrification of heavy transport and logistics centres are just some of the solutions that are being highlighted this week during [European Mobility Week 2025](#).

 Take this opportunity to explore the progress and challenges in this area of the future.

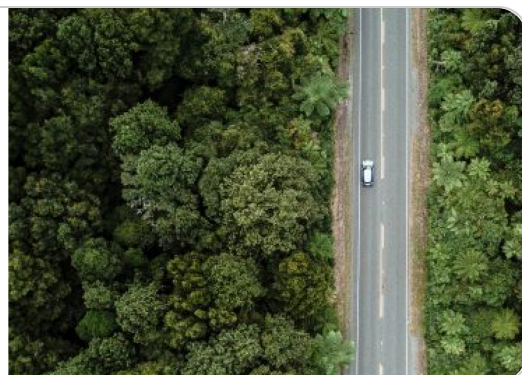

Everything you need to know about the electrification of transport
