

# Main privacy enhancement technologies

## Data obfuscation tools

Technology	Potential application	Challenges and limitations
Anonymisation / pseudonymisation	Secure storage	<ul style="list-style-type: none"><li>Ensuring information does not leak (re-identification risk)</li></ul>
Synthetic data	Machine learning with privacy preservation	<ul style="list-style-type: none"><li>Amplified bias, especially in synthetic data</li></ul>
Differential privacy	Expanding research opportunities	<ul style="list-style-type: none"><li>Lack of sufficient skills and expertise</li></ul>
Zero-knowledge proofs	Information verification without the need to disclose it (e.g. age verification)	Applications are still in early stages

## Encrypted data processing tools

Technology	Potential application	Challenges and limitations
Homomorphic encryption	<ul style="list-style-type: none"><li>Calculations on encrypted data within the same organisation</li></ul>	<ul style="list-style-type: none"><li>Challenges in data cleaning</li></ul>
Multiparty computation (including private set intersection)	<ul style="list-style-type: none"><li>Processing of data too sensitive to disclose</li><li>Tracing or discovering contacts</li></ul>	<ul style="list-style-type: none"><li>Ensuring information does not leak</li><li>Higher computational costs</li></ul>
Trusted Execution Environments	Computing with models that must remain private	<ul style="list-style-type: none"><li>Higher computational costs</li><li>Digital security challenges</li></ul>

## Federated and distributed analytics

Technology	Potential application	Challenges and limitations
Federated learning	Machine learning with privacy preservation	<ul style="list-style-type: none"><li>Reliable connectivity needed</li><li>Information about data models must be available to the data processor</li></ul>
Distributed analytics		

## Data accountability tools

Technology	Potential application	Challenges and limitations
Accountability systems	<ul style="list-style-type: none"><li>Setting and enforcing rules on when data can be accessed</li><li>Immutable tracking of data access by data controllers</li></ul>	<ul style="list-style-type: none"><li>Limited use cases and lack of autonomous applications</li><li>Configuration complexity</li><li>Privacy and data protection compliance risks when using distributed ledger technologies (DLT)</li><li>Digital security challenges</li><li>Not strictly considered PETs</li></ul>
Threshold secret sharing		
Personal data stores / Personal Information Management Systems (PIMS)	Give data subjects control over their own data
