How can we adapt mobility to the reality of life after COVID-19?

Reorganise public spaces to prioritise active mobility
Take advantage of the reduction in the number of motorised journeys to devote wide spaces to bicycles and pedestrians.

Make public transport as safe as possible
Minimise the risk of infection by reducing the number of passengers, improving disinfection and promoting the use of facemasks.

Encourage rational use of private cars, taxis and shared vehicles
Introduce shared taxi and shared vehicle services to reduce the need for private cars.

Employ technology to manage and programme mobility
Apps can help the public to find the best routes, avoid congestion and use safer payment methods.

Change working and buying habits
Providing more flexible time-management options will help reduce traffic congestion.
